A Jewel in the Crown

The college’s Skinner organ has returned from its two-year restoration better than ever

With a flick of a switch, the college’s Skinner organ comes to life.

Somewhere beneath the chapel, the motor has started humming, awaiting the command to breathe through the instrument and fill the space with sound. A little further away and just that bit of background sound probably wouldn’t register, but from a vantage point near the chancel-based console, with the rest of Dimnent absolutely still, it quite convincingly conveys an impression of restored power.

Nick Thompson-Allen, who has long been associated with the church organ industry, has returned from his two-year restoration project to Fort Valley, Ga., with the thousand-pipe Skinner organ that he and his team have labored to rebuild. The organ is one of the few Skinner organs that survive in their original condition, and it is one of the few left that can be played, thanks to the efforts of the college and Dr. Lewis. The organ has been praised as one of the best in the world and is a testament to the skill of the original builders. The organ was moved from the college in 2005 for its first major restoration since being installed in 1928. The work was completed in January 2006, and the organ was restored to its original condition.

The organ is located in the chapel and is the largest organ in the United States. It is one of only a few remaining original Skinner organs, and it is considered one of the great organs of the 20th century. The organ was originally installed in 1928 and has been in continuous use since then.

The organ has been praised for its beautiful sound and its ability to create a sense of sacred space. It is considered one of the most important organs in the world, and it is a testament to the skill of the original builders.
